

For Day 2 and Day 3 of evaluations, this bar graph depicts that VOC emissions are decreasing as more biochar is added to the soil. These reductions seem to decrease as more and more biochar is added, which suggests a maximum limit of biochar until VOC reduction tapers off.

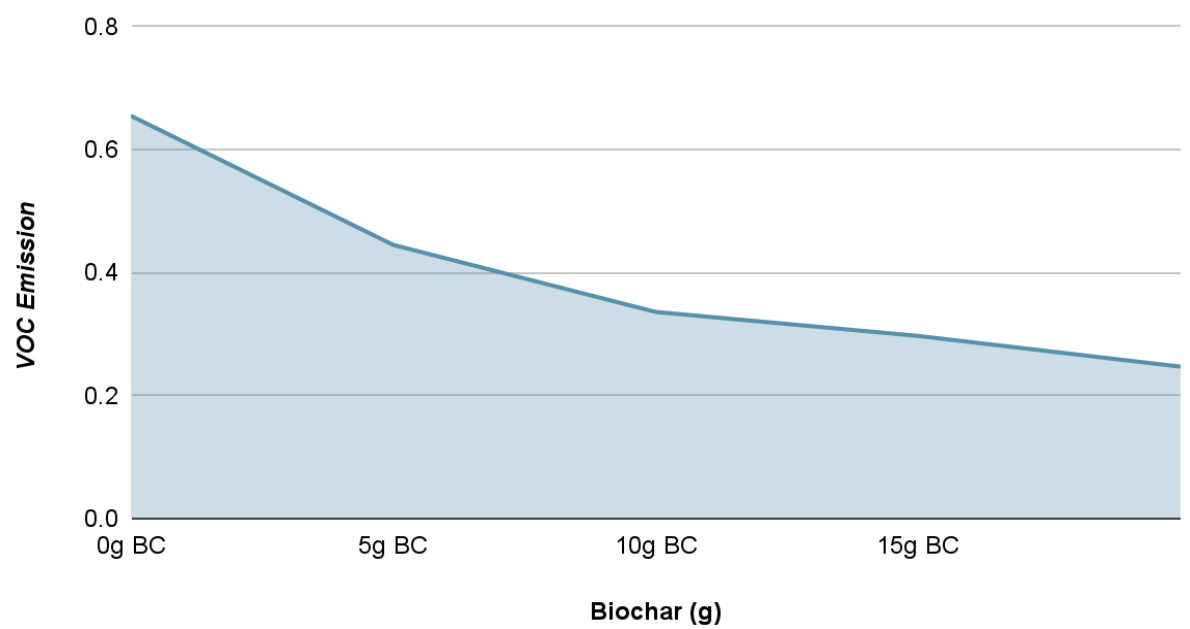

This graph also shows the reduction of VOC emissions as more biochar is added to the Sample. This graph is another easier way to see the decrease in VOC emissions.

## Biochar vs VOC

## Biochar vs VOC

As for the graphs shown above, the relationship between VOC Emissions and Biochar is displayed using a dot chart, thus illustrating the further decrease in VOC emissions. These relationships can also be displayed in the second way, which still stands that more biochar being applied will still decrease VOC emissions.
